

Perimeter Defense Craft: The Full Stack

The assembled perimeter

```
[Internet]
| DNS filtering (block C2/bad domains - DNS Rebinding controls)
v Email gateway (spam/phishing sandboxing, banner, SPF/DMARC)
v SASE/Proxy (web filtering, TLS inspection, CASB)
v Firewall/NGFW + IPS (state, policy, inline threat)
v WAF (front of web apps)
v ZTNA / VPN (identity access)
v --- LAN/DMZ with segmentation ---
```

DNS filtering : overlooked gold

Block known-malicious domains at the resolver (RPZ/domain blocklists, Cisco Umbrella-style)

Blocks C2 beacons, phishing, DGA-callbacks – cheap, effective

Email security = the top vector you're likely to touch

SPF/DKIM/DMARC (sender authentication)

Threat gateway analysis (sandbox attachments, URL rewrite deferral)

Banner ads for external senders (training reinforcement)

SASE route

Security Access Service Edge = converge networking+security into cloud edge (SWG, CASB, FWaaS, ZTNA). Mainstream; enterprise-al.

Hand-off to detection

The perimeter generates its own telemetry: DNS queries to blocklist, mail quarantine events, proxy HTTP/S flows, NGFW/IPS alerts. These feed

SIEM/SOAR to enrich endpoint detections.

Building discipline

Log-and-tune everything before blocking

Know your choke points (a company with no email gateway = the phishing sieve)

Test bypasses (TLS inspection-gap, DNS-over-HTTPS bypass on endpoints!)

Document the 'block → examine → allowlist' workflow so users don't hate you

What a strong perimeter buys

Time. Every blocked deliver/asked callback = minutes the IR team doesn't have to burn. The perimeter that quietly removes 90% of noise makes every detection that remains matter.

Perimeter is not 'one product'. It's
DNS+mail+web+firewall+WAF+identity working as ONE system that hands every alarm + context to the SOC.
