PHASE 7 • ADVANCED

Reverse Engineering & Exploit Development

Reading binaries without reading binaries: disassembly ground rules, stack/Linux ELF exploitation, ret2libc, ROP, and a clean lab drill to earn the exploit badge.

01

Disassembly: objdump, Ghidra, IDA

INTERMEDIATE

LAB

45 min →

Turning binaries into readable code: file type, sections, mnemonics, ...

02

Debugging with GDB: Breakpoints, Registers, Assembly

INTERMEDIATE

LAB

50 min →

GDB under the hood: disassembling on the fly, setting breakpoints at ...

03

Stack Exploitation: Overflow to Shellcode

ADVANCED

LAB

60 min →

The real deal: buffer overflows on x86-64, ASLR/NX/CANARY, and why 'c...

04

Ret2libc, ROP & Chains

ADVANCED

LAB

60 min →

Without shellcode on the stack you still have GOT and libc: return-to...

05

Format String Attacks: Arbitrary Read/Write

ADVANCED

LAB

45 min →

The OTHER classic: printf bugs that read AND write memory anywhere - ...

06

Fuzzing, CVEs & Reading Advisories

INTERMEDIATE

LAB

45 min →

Happy path ends: instead of grokking every bug by hand, let the machi...
